

HOW IT WORKS

Home Generator Systems feature a continuous fuel supply from either Natural Gas or Propane and are permanently connected to your homes electrical system for an automatic response to power failure.

- 1** *The Home Generator System's advanced electronics continually monitor your home's connection to local utility power.*
- 2** *When utility power is disrupted, the system confirms that a true power outage has occurred and signals the standby generator to start.*
- 3** *The system supplies backup power to your home within 30 seconds. When utility power is restored, the system automatically senses it, restores utility power, and resumes monitoring until the next utility failure.*
